CHAPTER 1

Introduction

This report gives the result of running the computer algebra independent integration test.The download section in on the main webpage contains links to download the problems in plain text format used for all CAS systems. The number of integrals in this report is [**507**]. This is test number [99].

1.1 Listing of CAS systems tested

The following are the CAS systems tested:

1. Mathematica 14 (January 9, 2024) on windows 10 pro.
2. Rubi 4.17.3 (Sept 25, 2023) on Mathematica 14 on windows 10m pro.
3. Maple 2024 (March 1, 2024) on windows 10 pro.
4. Maxima 5.47 (June 1, 2023) using Lisp SBCL 2.4.0 on Linux Manjaro 23.1.2 KDE via sagemath 10.3.
5. FriCAS 1.3.10 built with sbcl 2.3.11 (January 10, 2024) on Linux Manjaro 23.1.2 KDE via sagemath 10.3.
6. Giac/Xcas 1.9.0-99 on Linux via sagemath 10.3.
7. Sympy 1.12 using Python 3.11.6 (Nov 14 2023, 09:36:21) [GCC 13.2.1 20230801] on Linux Manjaro 23.1.2 KDE.
8. Mupad using Matlab 2021a with Symbolic Math Toolbox Version 8.7 on windows 10.
9. Reduce CSL rev 6687 (January 9, 2024) on Linux Manjaro 23.1.2 KDE.

Maxima and Fricas and Giac are called using Sagemath. This was done using Sagemath `integrate` command by changing the name of the algorithm to use the different CAS systems.

Sympy was run directly in Python not via sagemath.

Reduce was called directly.

1.2 Results

Important note: A number of problems in this test suite have no antiderivative in closed form. This means the antiderivative of these integrals can not be expressed in terms of elementary, special functions or `Hypergeometric2F1` functions. `RootSum` and `RootOf` are not allowed. If a CAS returns the above integral unevaluated within the time limit, then the result is counted as passed and assigned an A grade.

However, if CAS times out, then it is assigned an F grade even if the integral is not integrable, as this implies CAS could not determine that the integral is not integrable in the time limit.

If a CAS returns an antiderivative to such an integral, it is assigned an A grade automatically and this special result is listed in the introduction section of each individual test report to make it easy to identify as this can be important result to investigate.

The results given in in the table below reflects the above.

System	% solved	% Failed
Rubi	99.61 (505)	0.39 (2)
Mathematica	99.21 (503)	0.79 (4)
Maple	96.45 (489)	3.55 (18)
Fricas	89.94 (456)	10.06 (51)
Giac	78.30 (397)	21.70 (110)
Reduce	76.73 (389)	23.27 (118)
Maxima	70.02 (355)	29.98 (152)
Mupad	55.82 (283)	44.18 (224)
Sympy	47.14 (239)	52.86 (268)

Table 1.1: Percentage solved for each CAS

The table below gives additional break down of the grading of quality of the antiderivatives generated by each CAS. The grading is given using the letters A,B,C and F with A being the best quality. The grading is accomplished by comparing the antiderivative generated with the optimal antiderivatives included in the test suite. The following table describes the meaning of these grades.

grade	description
A	Integral was solved and antiderivative is optimal in quality and leaf size.
B	Integral was solved and antiderivative is optimal in quality but leaf size is larger than twice the optimal antiderivatives leaf size.
C	Integral was solved and antiderivative is non-optimal in quality. This can be due to one or more of the following reasons 1. antiderivative contains a hypergeometric function and the optimal antiderivative does not. 2. antiderivative contains a special function and the optimal antiderivative does not. 3. antiderivative contains the imaginary unit and the optimal antiderivative does not.
F	Integral was not solved. Either the integral was returned unevaluated within the time limit, or it timed out, or CAS hanged or crashed or an exception was raised.

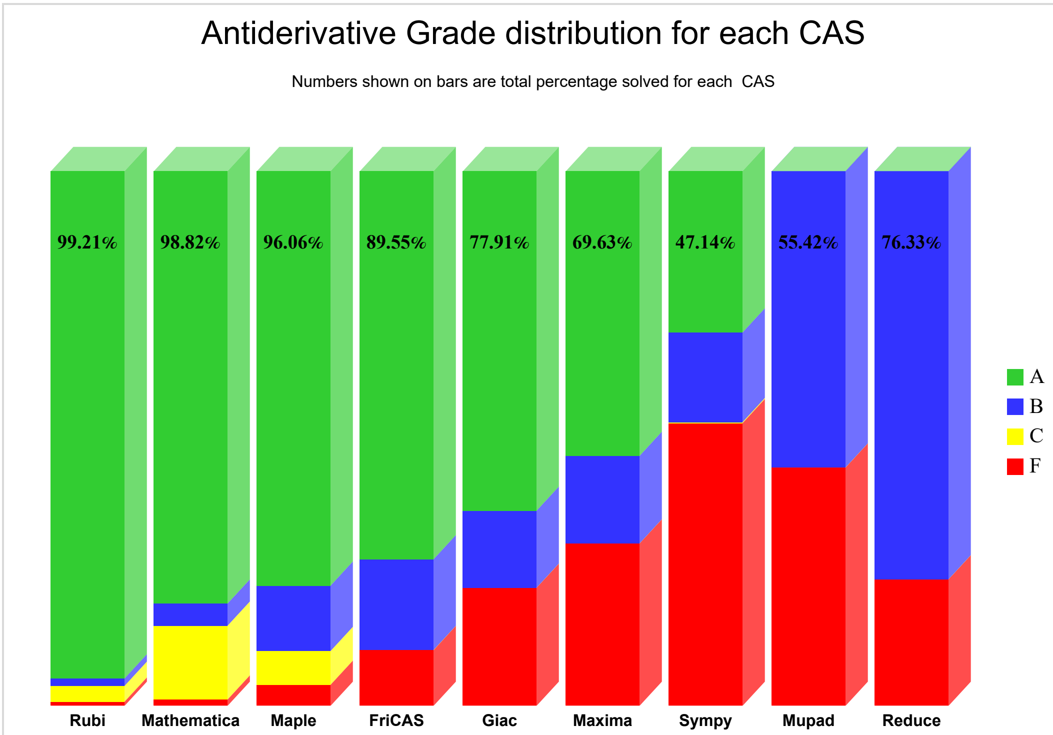
Table 1.2: Description of grading applied to integration result

Grading is implemented for all CAS systems. Based on the above, the following table summarizes the grading for this test suite.

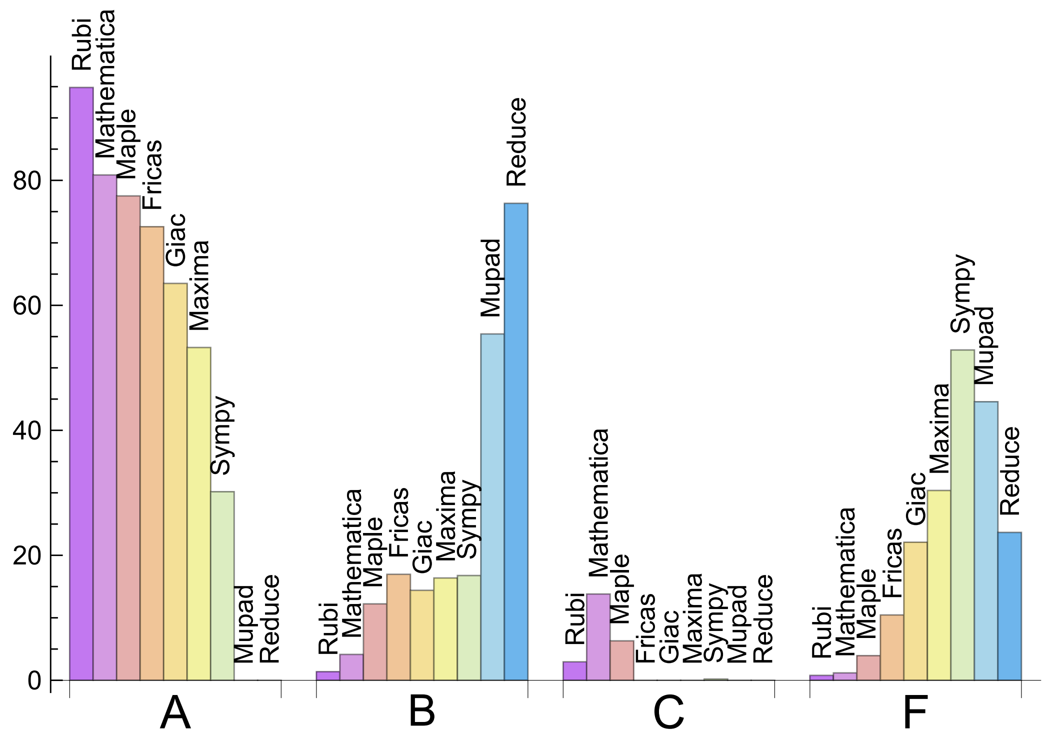
System	% A grade	% B grade	% C grade	% F grade
Rubi	94.872	1.381	2.959	0.789
Mathematica	80.868	4.142	13.807	1.183
Maple	77.515	12.229	6.312	3.945
Fricas	72.584	16.963	0.000	10.454
Giac	63.511	14.398	0.000	22.091
Maxima	53.254	16.371	0.000	30.375
Sympy	30.178	16.765	0.197	52.860
Mupad	0.000	55.424	0.000	44.576
Reduce	0.000	76.331	0.000	23.669

Table 1.3: Antiderivative Grade distribution of each CAS

The following is a Bar chart illustration of the data in the above table.



The figure below compares the grades of the CAS systems.



The following table shows the distribution of the different types of failures for each CAS. There are 3 types failures. The first is when CAS returns the input within the time limit, which means it could not solve it. This is the typical failure and given as **F**.

The second failure is due to time out. CAS could not solve the integral within the 3 minutes time limit which is assigned. This is assigned **F(-1)**.

The third is due to an exception generated, indicated as **F(-2)**. This most likely indicates an interface problem between sagemath and the CAS (applicable only to FriCAS, Maxima and Giac) or it could be an indication of an internal error in the CAS itself. This type of error requires more investigation to determine the cause.

System	Number failed	Percentage normal failure	Percentage timeout failure	Percentage exception failure
Rubi	2	100.00	0.00	0.00
Mathematica	4	100.00	0.00	0.00
Maple	18	100.00	0.00	0.00
Fricas	51	56.86	43.14	0.00
Giac	110	78.18	0.91	20.91
Reduce	118	100.00	0.00	0.00
Maxima	152	75.66	0.00	24.34
Mupad	224	0.00	100.00	0.00
Sympy	268	80.22	19.03	0.75

Table 1.4: Failure statistics for each CAS

1.3 Time and leaf size Performance

The table below summarizes the performance of each CAS system in terms of time used and leaf size of results.

Mean size is the average leaf size produced by the CAS (before any normalization). The Normalized mean is relative to the mean size of the optimal anti-derivative given in the input files.

For example, if CAS has **Normalized mean** of 3, then the mean size of its leaf size is 3 times as large as the mean size of the optimal leaf size.

Median size is value of leaf size where half the values are larger than this and half are smaller (before any normalization). i.e. The Middle value.

Similarly the **Normalized median** is relative to the median leaf size of the optimal.

For example, if a CAS has Normalized median of 1.2, then its median is 1.2 as large as the median leaf size of the optimal.

System	Mean time (sec)
Maxima	0.06
Giac	0.30
Rubi	0.56
Reduce	0.82
Maple	1.36
Fricas	2.79
Mathematica	3.89
Sympy	4.14
Mupad	6.10

Table 1.5: Time performance for each CAS

System	Mean size	Normalized mean	Median size	Normalized median
Maxima	168.88	1.30	129.00	1.05
Rubi	174.45	0.94	124.00	1.00
Mathematica	213.60	1.07	126.00	0.96
Maple	329.83	1.37	124.00	0.93
Giac	464.31	1.91	128.00	0.93
Reduce	481.61	3.58	67.00	0.64
Fricas	641.73	2.48	119.00	1.00
Sympy	1046.97	5.99	131.00	1.33
Mupad	1174.36	3.71	118.00	1.00

Table 1.6: Leaf size performance for each CAS

1.4 Performance based on number of rules Rubi used

This section shows how each CAS performed based on the number of rules Rubi needed to solve the same integral. One diagram is given for each CAS.

On the y axis is the percentage solved which Rubi itself needed the number of rules given the x axis. These plots show that as more rules are needed then most CAS system percentage of solving decreases which indicates the integral is becoming more complicated to solve.

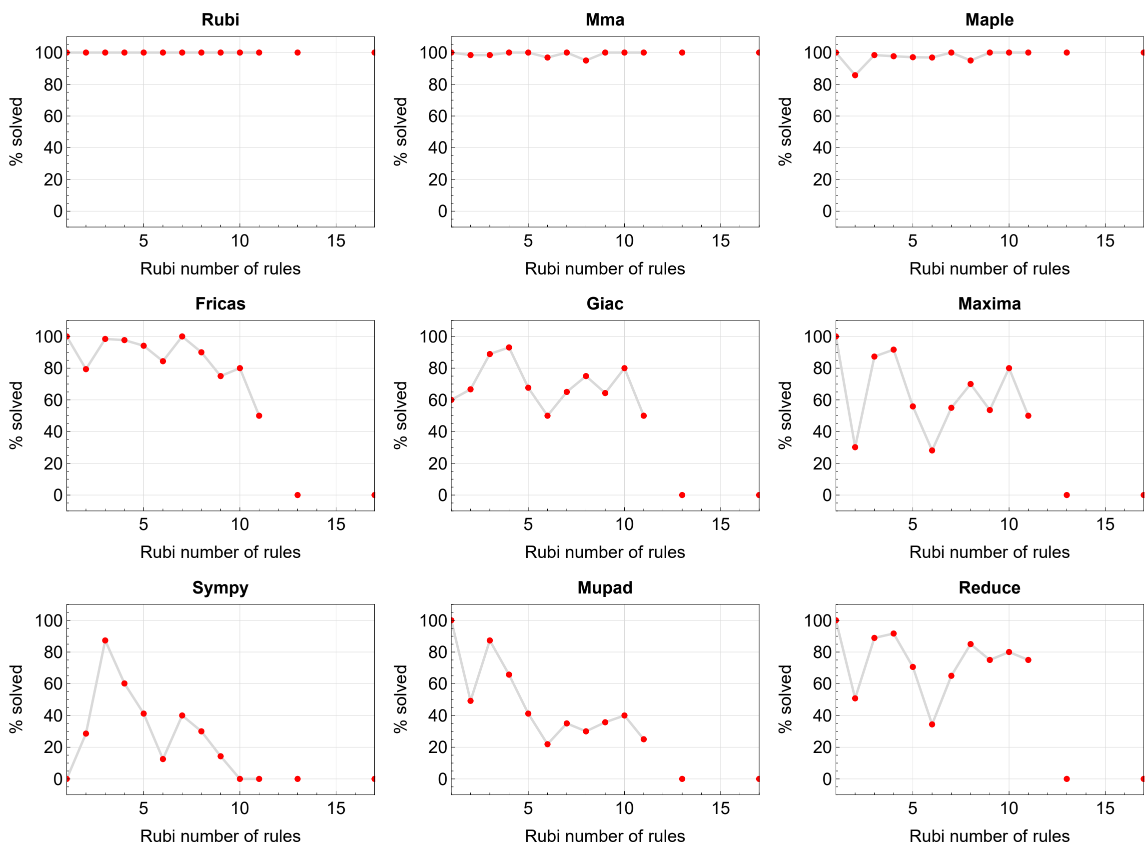


Figure 1.1: Solving statistics per number of Rubi rules used

1.5 Performance based on number of steps Rubi used

This section shows how each CAS performed based on the number of steps Rubi needed to solve the same integral. Note that the number of steps Rubi needed can be much higher than the number of rules, as the same rule could be used more than once.

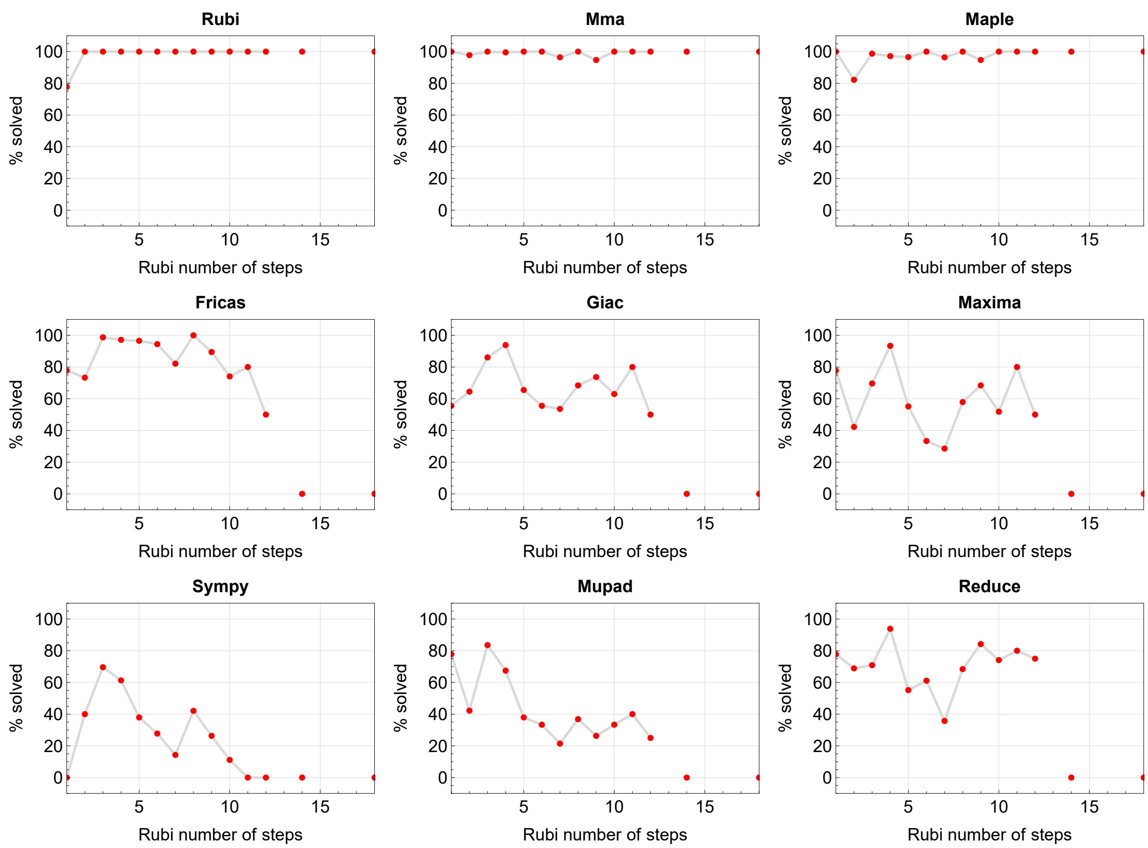

Figure 1.2: Solving statistics per number of Rubi steps used

The above diagram show that the precentage of solved intergals decreases for most CAS systems as the number of steps increases. As expected, for integrals that required less steps by Rubi, CAS systems had more success which indicates the integral was not as hard to solve. As Rubi needed more steps to solve the integral, the solved percentage decreased for most CAS systems which indicates the integral is becoming harder to solve.

1.6 Solved integrals histogram based on leaf size of result

The following shows the distribution of solved integrals for each CAS system based on leaf size of the antiderivatives produced by each CAS. It shows that most integrals solved produced leaf size less than about 100 to 150. The bin size used is 40.

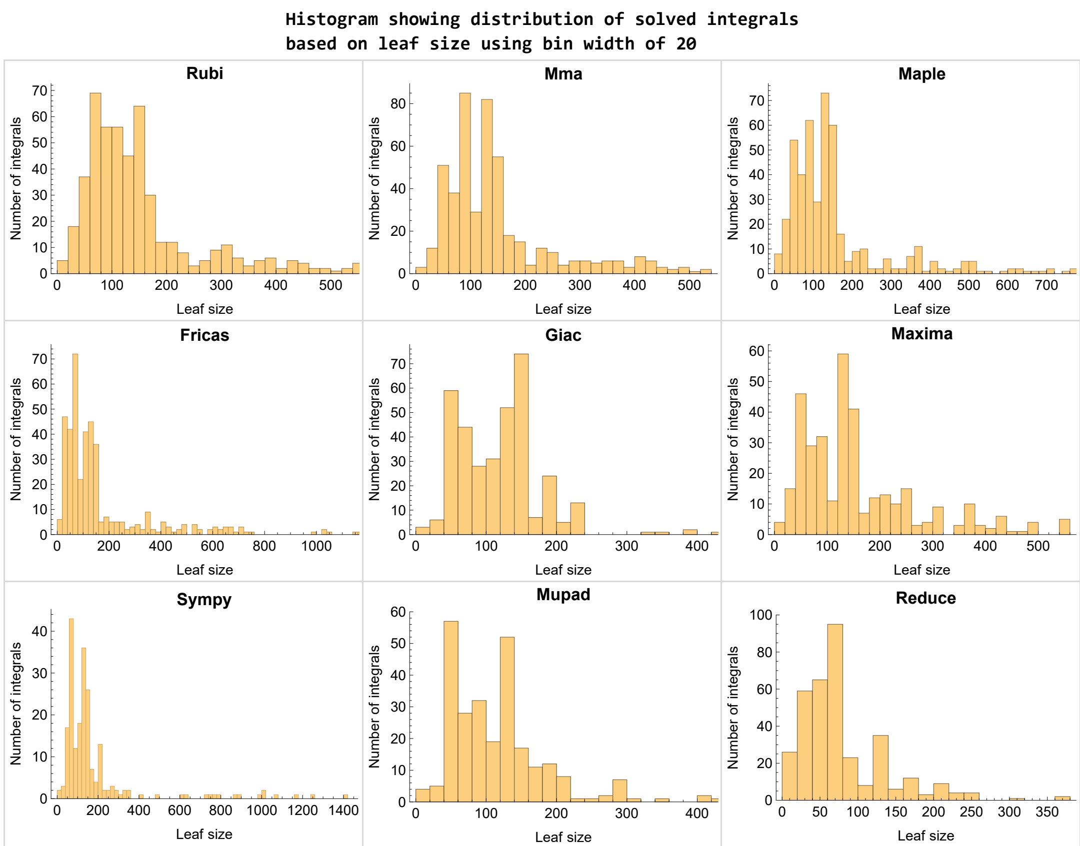

Figure 1.3: Solved integrals based on leaf size distribution

1.7 Solved integrals histogram based on CPU time used

The following shows the distribution of solved integrals for each CAS system based on CPU time used in seconds. The bin size used is 0.1 second.

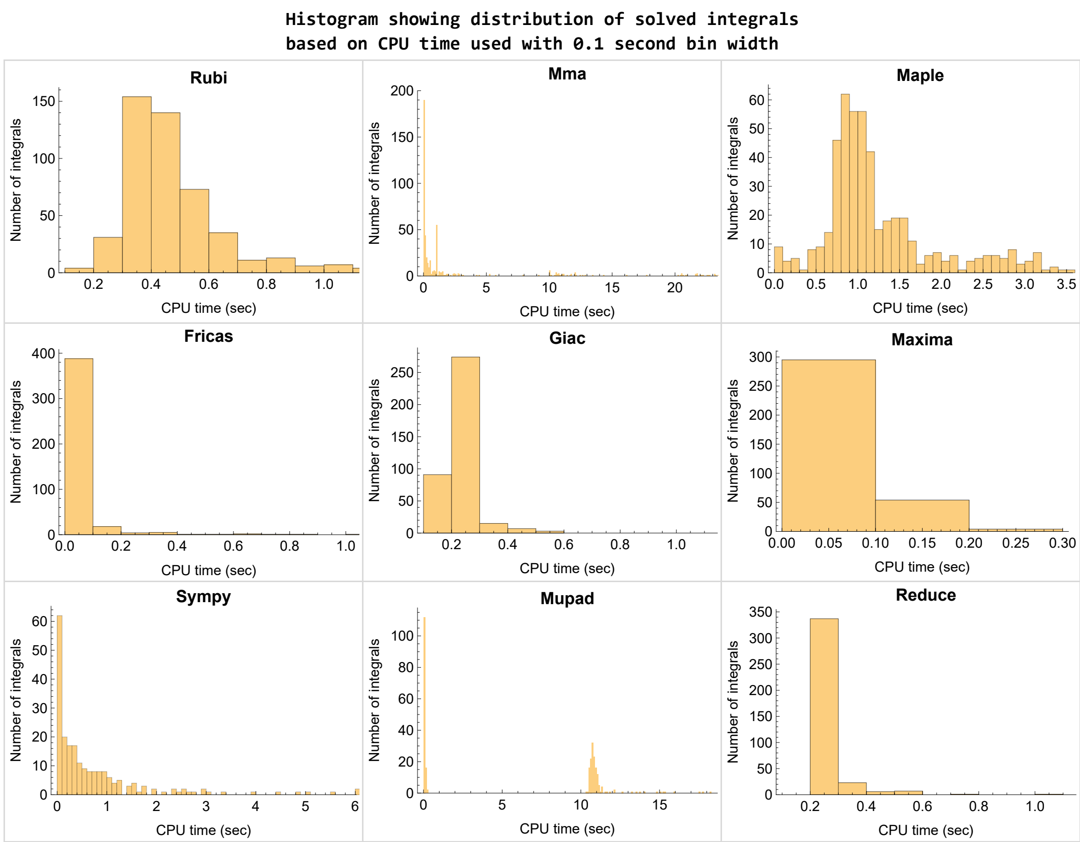

Figure 1.4: Solved integrals histogram based on CPU time used

1.8 Leaf size vs. CPU time used

The following shows the relation between the CPU time used to solve an integral and the leaf size of the antiderivative.

The result for Fricas, Maxima and Giac is shifted more to the right than the other CAS system due to the use of sagemath to call them, which causes an initial slight delay in the timing to start the integration due to overhead of starting a new process each time. This should also be taken into account when looking at the timing of these three CAS systems. Direct calls not using sagemath would result in faster timings, but current implementation uses sagemath as this makes testing much easier to do.

1.11 list of integrals solved by CAS but failed verification

The following are integrals solved by CAS but the verification phase failed to verify the anti-derivative produced is correct. This does not necessarily mean that the anti-derivative is wrong as additional methods of verification might be needed, or more time is needed (3 minutes time limit was used). These integrals are listed here to make it possible to do further investigation to determine why the result could not be verified.

Rubi {92, 93, 94, 100, 101, 102, 103, 104, 105, 106, 107, 108, 110, 111, 112, 113, 115, 116, 474, 477, 484, 488, 491, 495, 498, 502, 505}

Mathematica {52, 481, 484}

Maple {144, 145, 146, 147, 148, 149, 150, 151, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 286, 287, 288, 289, 290, 291, 292, 293, 411, 412, 413, 414, 415, 416, 417, 418, 419}

Maxima Verification phase not currently implemented.

Fricas Verification phase not currently implemented.

Sympy Verification phase not currently implemented.

Giac Verification phase not currently implemented.

Reduce Verification phase not currently implemented.

Mupad Verification phase not currently implemented.

1.12 Timing

The command `AbsoluteTiming[]` was used in Mathematica to obtain the elapsed time for each integrate call. In Maple, the command `Usage` was used as in the following example

```
cpu_time := Usage(assign ('result_of_int',int(expr,x)),output='realtime'
```

For all other CAS systems, the elapsed time to complete each integral was found by taking the difference between the time after the call completed from the time before the call was made. This was done using Python's `time.time()` call.

All elapsed times shown are in seconds. A time limit of 3 CPU minutes was used for each integral. If the integrate command did not complete within this time limit, the integral was aborted and considered to have failed and assigned an F grade. The time used by failed integrals due to time out was not counted in the final statistics.

1.13 Verification

A verification phase was applied on the result of integration for `Rubi` and `Mathematica`.

Future version of this report will implement verification for the other CAS systems. For the integrals whose result was not run through a verification phase, it is assumed that the antiderivative was correct.

Verification phase also had 3 minutes time out. An integral whose result was not verified could still be correct, but further investigation is needed on those integrals.

These integrals were marked in the summary table below and also in each integral separate section so they are easy to identify and locate.

1.14 Important notes about some of the results

Important note about Maxima results

Since tests were run in a batch mode, and using an automated script, then any integral where Maxima needed an interactive response from the user to answer a question during the evaluation of the integral will fail.

The exception raised is `ValueError`. Therefore Maxima results is lower than what would result if Maxima was run directly and each question was answered correctly.

The percentage of such failures were not counted for each test file, but for an example, for the `Timofeev` test file, there were about 14 such integrals out of total 705, or about 2 percent. This percentage can be higher or lower depending on the specific input test file.

Such integrals can be identified by looking at the output of the integration in each section for Maxima. The exception message will indicate the cause of error.

Maxima integrate was run using SageMath with the following settings set by default

```
'besselexpand : true'
'display2d : false'
'domain : complex'
'keepfloat : true'
'load(to_poly_solve)'
'load(simplify_sum)'
'load(abs_integrate)' 'load(diag)'
```

SageMath automatic loading of Maxima `abs_integrate` was found to cause some problems. So the following code was added to disable this effect.

```
from sage.interfaces.maxima_lib import maxima_lib
maxima_lib.set('extra_definite_integration_methods', '[]')
maxima_lib.set('extra_integration_methods', '[]')
```

See https://ask.sagemath.org/question/43088/integrate-results-that-are-different-from-using-maxima/ for reference.

Important note about FriCAS result

There were few integrals which failed due to SageMath interface and not because FriCAS system could not do the integration.

These will fail With error `Exception raised: NotImplementedError`.

The number of such cases seems to be very small. About 1 or 2 percent of all integrals. These can be identified by looking at the exception message given in the result.

Important note about finding leaf size of antiderivative

For Mathematica, Rubi, and Maple, the builtin system function `LeafSize` was used to find the leaf size of each antiderivative.

The other CAS systems (SageMath and Sympy) do not have special builtin function for this purpose at this time. Therefore the leaf size for Fricas and Sympy antiderivative was determined using the following function, thanks to user `slelievre` at https://ask.sagemath.org/question/57123/could-we-have-a-leaf_count-function-in-base-sagemath/

```
def tree_size(expr):
    r"""
    Return the tree size of this expression.
    """
    if expr not in SR:
        # deal with lists, tuples, vectors
        return 1 + sum(tree_size(a) for a in expr)
    expr = SR(expr)
    x, aa = expr.operator(), expr.operands()
    if x is None:
        return 1
    else:
        return 1 + sum(tree_size(a) for a in aa)
```

For Sympy, which was called directly from Python, the following code was used to obtain the leafsize of its result

```
try:
  # 1.7 is a fudge factor since it is low side from actual leaf count
  leafCount = round(1.7*count_ops(anti))

  except Exception as ee:
        leafCount =1
```

Important note about Mupad results

Matlab's symbolic toolbox does not have a leaf count function to measure the size of the antiderivative. Maple was used to determine the leaf size of Mupad output by post processing Mupad result.

Currently no grading of the antiderivative for Mupad is implemented. If it can integrate the problem, it was assigned a B grade automatically as a placeholder. In the future, when grading function is implemented for Mupad, the tests will be rerun again.

The following is an example of using Matlab's symbolic toolbox (Mupad) to solve an integral

```
integrand = evalin(symengine,'cos(x)*sin(x)')
the_variable = evalin(symengine,'x')
anti = int(integrand,the_variable)
```

Which gives `sin(x)^2/2`

2.2 Detailed conclusion table per each integral for all CAS systems

Detailed conclusion table per each integral is given by the table below. The elapsed time is in seconds. For failed result it is given as **F(-1)** if the failure was due to timeout. It is given as **F(-2)** if the failure was due to an exception being raised, which could indicate a bug in the system. If the failure was due to integral not being evaluated within the time limit, then it is given as **F**.

In this table, the column `N.S.` means **normalized size** and is defined as $\frac{\text{antiderivative leaf size}}{\text{optimal antiderivative leaf size}}$. To make the table fit the page, the name `Mathematica` was abbreviated to `MMA`.

2.3 Detailed conclusion table specific for Rubi results

The following table is specific to Rubi only. It gives additional statistics for each integral. the column **steps** is the number of steps used by Rubi to obtain the antiderivative. The **rules** column is the number of unique rules used. The **integrand size** column is the leaf size of the integrand. Finally the ratio $\frac{\text{number of rules}}{\text{integrand size}}$ is also given. The larger this ratio is, the harder the integral is to solve. In this test file, problem number [108] had the largest ratio of [.68000000000000049]

Table 2.1: Rubi specific breakdown of results for each integral

CHAPTER 3

LISTING OF INTEGRALS

3.1 $\int \frac{x^3(a+bx+cx^2)}{d+ex}\,dx$

Optimal result

Integrand size = 21, antiderivative size = 137

$$\int \frac{x^3(a+bx+cx^2)}{d+ex}\,dx = \frac{d^2(cd^2-bde+ae^2)\,x}{e^5} - \frac{d(cd^2-bde+ae^2)\,x^2}{2e^4} + \frac{(cd^2-bde+ae^2)\,x^3}{3e^3} - \frac{(cd-be)x^4}{4e^2} + \frac{cx^5}{5e} - \frac{d^3(cd^2-bde+ae^2)\log(d+ex)}{e^6}$$

output
```
d^2*(a*e^2-b*d*e+c*d^2)*x/e^5-1/2*d*(a*e^2-b*d*e+c*d^2)*x^2/e^4+1/3*(a*e^2
-b*d*e+c*d^2)*x^3/e^3-1/4*(-b*e+c*d)*x^4/e^2+1/5*c*x^5/e-d^3*(a*e^2-b*d*e+
c*d^2)*ln(e*x+d)/e^6
```

Mathematica [A] (verified)

Time = 0.07 (sec) , antiderivative size = 132, normalized size of antiderivative = 0.96

$$\int \frac{x^3(a+bx+cx^2)}{d+ex}\,dx = \frac{60d^2e(cd^2+e(-bd+ae))\,x - 30de^2(cd^2+e(-bd+ae))\,x^2 + 20e^3(cd^2+e(-bd+ae))\,x^3 + 15e^4(-cd+}{60e^6}$$

input
```
Integrate[(x^3*(a + b*x + c*x^2))/(d + e*x),x]
```

output
```
(60*d^2*e*(c*d^2 + e*(-(b*d) + a*e))*x - 30*d*e^2*(c*d^2 + e*(-(b*d) + a*e
))*x^2 + 20*e^3*(c*d^2 + e*(-(b*d) + a*e))*x^3 + 15*e^4*(-(c*d) + b*e)*x^4
 + 12*c*e^5*x^5 - 60*(c*d^5 + d^3*e*(-(b*d) + a*e))*Log[d + e*x])/(60*e^6)
```

Rubi [A] (verified)

Time = 0.34 (sec) , antiderivative size = 137, normalized size of antiderivative = 1.00, number of steps used = 2, number of rules used = 2, $\frac{\text{number of rules}}{\text{integrand size}} = 0.095$, Rules used = {1195, 2009}

Below are the steps used by Rubi to obtain the solution. The rule number used for the transformation is given above next to the arrow. The rules definitions used are listed below.

$$\int \frac{x^3(a+bx+cx^2)}{d+ex}dx$$

$$\Big\downarrow \text{1195}$$

$$\int \left(\frac{d^2(ae^2-bde+cd^2)}{e^5}-\frac{dx(ae^2-bde+cd^2)}{e^4}+\frac{x^2(ae^2-bde+cd^2)}{e^3}-\frac{d^3(ae^2-bde+cd^2)}{e^5(d+ex)}+\frac{x^3(be-cd)}{e^2}\right.$$

$$\Big\downarrow \text{2009}$$

$$\frac{d^2x(ae^2-bde+cd^2)}{e^5}-\frac{dx^2(ae^2-bde+cd^2)}{2e^4}+\frac{x^3(ae^2-bde+cd^2)}{3e^3}-\frac{d^3\log(d+ex)(ae^2-bde+cd^2)}{e^6}-\frac{x^4(cd-be)}{4e^2}+\frac{cx^5}{5e}$$

input
```
Int[(x^3*(a + b*x + c*x^2))/(d + e*x),x]
```

output
```
(d^2*(c*d^2 - b*d*e + a*e^2)*x)/e^5 - (d*(c*d^2 - b*d*e + a*e^2)*x^2)/(2*e
^4) + ((c*d^2 - b*d*e + a*e^2)*x^3)/(3*e^3) - ((c*d - b*e)*x^4)/(4*e^2) +
(c*x^5)/(5*e) - (d^3*(c*d^2 - b*d*e + a*e^2)*Log[d + e*x])/e^6
```

Defintions of rubi rules used

rule 1195
```

Rubi [A] (verified)

Time = 1.10 (sec) , antiderivative size = 327, normalized size of antiderivative = 1.11, number of steps used = 12, number of rules used = 11, $\frac{\text{number of rules}}{\text{integrand size}}$ = 0.440, Rules used = {1267, 27, 2184, 27, 2184, 27, 1269, 1092, 219, 1154, 219}

Below are the steps used by Rubi to obtain the solution. The rule number used for the transformation is given above next to the arrow. The rules definitions used are listed below.

$$\int \frac{x^4}{(d+ex)\sqrt{a+bx+cx^2}}\,dx$$

$$\Big\downarrow \text{1267}$$

$$\frac{\int -\frac{e^3(14cd+5be)x^3+e^2\left(10cd^2+e(11bd+4ae)\right)x^2+de\left(2cd^2+e(7bd+8ae)\right)x+d^2e(bd+4ae)}{2(d+ex)\sqrt{cx^2+bx+a}}dx}{3ce^4}+\frac{(d+ex)^2\sqrt{a+bx+cx^2}}{3ce^3}$$

$$\Big\downarrow \text{27}$$

$$\frac{(d+ex)^2\sqrt{a+bx+cx^2}}{3ce^3}-\frac{\int \frac{e^3(14cd+5be)x^3+e^2\left(10cd^2+e(11bd+4ae)\right)x^2+de\left(2cd^2+e(7bd+8ae)\right)x+d^2e(bd+4ae)}{(d+ex)\sqrt{cx^2+bx+a}}dx}{6ce^4}$$

$\Big\downarrow$ 2184

Rubi [B] (warning: unable to verify)

Leaf count is larger than twice the leaf count of optimal. 1462 vs. 2(719) = 1438.

Time = 2.96 (sec) , antiderivative size = 1462, normalized size of antiderivative = 2.03, number of steps used = 18, number of rules used = 17, $\frac{\text{number of rules}}{\text{integrand size}} = 0.630$, Rules used = {1285, 2154, 1282, 2154, 25, 27, 1172, 321, 1269, 1172, 321, 327, 1279, 187, 413, 413, 412}

Below are the steps used by Rubi to obtain the solution. The rule number used for the transformation is given above next to the arrow. The rules definitions used are listed below.

$$\int \frac{\sqrt{d+ex}}{x^3\sqrt{a+bx+cx^2}}dx$$

$$\Big\downarrow \text{ 1285}$$

Rubi [A] (warning: unable to verify)

Time = 1.47 (sec) , antiderivative size = 829, normalized size of antiderivative = 1.32, number of steps used = 14, number of rules used = 13, $\frac{\text{number of rules}}{\text{integrand size}} = 0.481$, Rules used = {1282, 2154, 25, 27, 1269, 1172, 321, 327, 1279, 187, 413, 413, 412}

Below are the steps used by Rubi to obtain the solution. The rule number used for the transformation is given above next to the arrow. The rules definitions used are listed below.

$$\int \frac{1}{x^2\sqrt{d+ex}\sqrt{a+bx+cx^2}}dx$$

$$\Big\downarrow \text{ 1282}$$

Rubi [C] (warning: unable to verify)

Result contains complex when optimal does not.

Time = 0.46 (sec) , antiderivative size = 234, normalized size of antiderivative = 0.74, number of steps used = 9, number of rules used = 8, $\frac{\text{number of rules}}{\text{integrand size}} = 0.320$, Rules used = {1283, 27, 2184, 27, 1269, 1172, 321, 327}

Below are the steps used by Rubi to obtain the solution. The rule number used for the transformation is given above next to the arrow. The rules definitions used are listed below.

$$\int \frac{x^2\sqrt{x+7}}{\sqrt{5x^2+2x+3}}dx$$

$$\Big\downarrow \text{1283}$$

$$\frac{2}{25}x\sqrt{x+7}\sqrt{5x^2+2x+3}-\frac{1}{25}\int \frac{3\left(-9x^2+17x+14\right)}{\sqrt{x+7}\sqrt{5x^2+2x+3}}dx$$

$$\Big\downarrow \text{27}$$

$$\frac{2}{25}x\sqrt{x+7}\sqrt{5x^2+2x+3}-\frac{3}{25}\int \frac{-9x^2+17x+14}{\sqrt{x+7}\sqrt{5x^2+2x+3}}dx$$
